

# Profile's Front-End

---

## 1 Introduction

In this documentation i will explain that i have done, so that the next person who do the page will understand the structure of the website more easier.

I have done 8 Front-End so far:

1. Main page (Profile)
2. Login page
3. Register page
4. Admin page
5. Patient page
6. Doctor page
7. Company page
8. Laboratory page

Overall: Those pages are created to manage users information. Designed like a clinical websites. In each pages,i have created, "Langague button" which can changes the text between Italian and English. Depending on the role of the user, each website has different uses.

One more important thing, although i have created the front pages but i didn't connect them with redirect yet. Plus, you need to connect database to users account and database with the website.

## 2 Main page (Profile)

This page is the demo for the login phase, actually im going to replace this page with login page, i only made this page to check the login and sign up function of Joomla. Overall this is not neccesarry, only use this page to login with super user account to modify the website.

## 3 Login page

In this page, there are few important things to notice. I created 5 button for users to choose before they enter their accounts. Users must choose the role first then log in. There are also "Register" and "Forget password". I already made the front of "Register", which i will explain in below. You need to create the "Forget password" function later.

## 4 Register page

Register page is simple just fill required information needed to login. And my idea was fill the important info later with (Patient,Doctor,Company,Lab) page later.

You also need to make a redirect from "Already have an account?" to the login page.

## 5 Admin page

This page use for Sant Andrea manager(currently: Ms Anita). You should aske her for super user account too. In this page, manager can control and manage information and functions of any roles. For example: booking, listing, modification,... i have made every functions as simple as i can. So anyone can understand quickly.

## 6 Patient,Doctor,Company,Lab page

These page are for lower level accounts.  
the idea for ranking was:

1. Admin
  - (a) Doctor
    - i. Patient
  - (b) Company
  - (c) Laboratory

These 4 pages are very simple, they can only modify their information, and booking or upload their personal file to higher level user.

## 7 Conclusion

I have made 80-90% of the Front-End a little bit of Back-End. The only thing has to do next is connecting with the database of the Sant Andrea, Managing accounts(Login and Register) and security of the website.
